

Aniqa Ayub

SUMMARY

I want to significantly improve the user experience of my cybersecurity portfolio website.

DO NOT remove any existing functionality. Instead, enhance the experience with the following requirements.

The website should no longer feel like a traditional portfolio.

It should feel like:

A Cyber Threat Intelligence Platform A Security Operations Center Dashboard An Analyst Command Console A Threat Hunting Workspace A Professional Security Research Environment

The experience should be memorable enough that recruiters and hiring managers remember it after leaving the website.

Maintain professionalism while adding excitement, exploration, interactivity, and cybersecurity authenticity.

Generate production-ready implementation and redesign the user experience accordingly.

CYBER TERMINAL LANDING PAGE (NEW HOMEPAGE)

When a visitor first opens the website, DO NOT immediately show the portfolio.

Instead, display a full-screen Cyber Operations Terminal Interface.

Use the existing terminal design as the foundation.

The terminal should feel like a professional SOC / Threat Intelligence Command Console rather than a traditional portfolio homepage.

Use realistic cybersecurity terminology throughout the interface.

Example startup sequence:

[BOOTING CYBER THREAT INTELLIGENCE PLATFORM...]

Initializing Threat Monitoring Engine... Loading Security Research Database... Establishing Secure Connection...

Loading Analyst Profile... Threat Feed Synchronized... System Status: ONLINE

ACCESS GRANTED

TERMINAL COMMAND MENU

The terminal should present an interactive command menu.

Use hacker/security terminology.

Display:

CYBER OPERATIONS COMMAND CENTER

[P] Portfolio [A] About Analyst [S] Security Metrics [T] Threat Intelligence [M] MITRE ATT&CK Expertise [C] Case Studies [R] Research Publications [X] Certifications [H] Help

Enter Command:

The user should be able to: Press P Press A Press S Press T Press M Press C Press R Press X

and instantly navigate to the corresponding section.

Implement both keyboard shortcuts and command input.

Examples: > p Navigating to Portfolio...

> s Loading Security Metrics...

> m Loading MITRE ATT&CK Knowledge Base...

PERSISTENT TERMINAL NAVIGATION

Every section of the website should display a small floating terminal prompt.

Example: [Press B to return to Command Center]

When B is pressed: Return user to terminal menu.

Smooth transition required.

HACKER-STYLE COMMANDS

Support additional cybersecurity-themed commands.

Examples: > whoami Aniq Ayub Cybersecurity Researcher AI Security Engineer

> skills Loading Security Capabilities...

> threat-status Threat Monitoring: ACTIVE

> certifications Loading Certification Repository...

> projects Loading Security Case Studies...

> help Display all available commands.

These commands should create a memorable experience for visitors.

SECURITY OVERVIEW PANEL POSITIONING

Currently there is a Security Overview box.

Move this component.

Position it on the RIGHT SIDE of the Hero section.

Layout: LEFT SIDE Aniq Ayub Cybersecurity Researcher AI Security Engineer Terminal Introduction

RIGHT SIDE Security Overview Dashboard Threat Monitoring Status Metrics System Health

This should resemble a professional SOC dashboard.

SECURITY METRICS REDESIGN

Current implementation uses progress bars.

Remove progress bars completely.

Replace them with professional visualizations.

Possible options: Radar Charts Line Graphs Area Charts Threat Intelligence Graphs Circular Analytics Security Performance Charts Interactive Data Visualizations

The section should feel like a security analytics dashboard rather than a skills page.

ADD EXPLORATION & EXCITEMENT

Currently the website feels too static.

I want visitors to feel excited to explore.

Add engaging interactions: Threat Detection Animations Scanning Effects Terminal Command Responses Cyber Intelligence Visualizations Node Connection Animations Interactive Cards Hover-based Data Reveals Smooth Motion Effects Animated Section Transitions Micro-interactions

Every section should encourage users to continue exploring.

The experience should feel like navigating a live cybersecurity platform.

DISCOVERY MECHANICS

Introduce exploration-based interactions.

Examples: Hidden Commands Terminal Easter Eggs Interactive Threat Logs Security Alerts Analyst Activity Feed
Live Status Messages Achievement Counters System Notifications

These should create curiosity and increase engagement.

TERMINAL AUTHENTICATION EXPERIENCE

Before showing the command center, add a short terminal initialization sequence.

Example: Authenticating User... Loading Threat Intelligence Platform... Decrypting Analyst Profile... Synchronizing
Threat Feeds... System Ready.

Duration: 3–5 seconds maximum.

Allow users to skip animation.
