

You are an expert Cybersecurity UI/UX Designer, Frontend Engineer, and Brand Strategist.

Redesign my cybersecurity portfolio website from a generic dark developer portfolio into a modern, enterprise-grade Cyber Threat Intelligence Platform while preserving all existing content, projects, and information.

PRIMARY OBJECTIVE

The website should look like a professional cybersecurity operations center (SOC), threat intelligence platform, or security analytics dashboard rather than a standard developer portfolio.

Target audience:

- Cybersecurity recruiters
- SOC analysts
- Security engineers
- Threat intelligence teams
- Researchers
- Hiring managers

The design should communicate:

- Threat Intelligence
- Security Operations
- Cyber Defense
- Threat Hunting
- Malware Analysis
- Vulnerability Research
- Incident Response

DO NOT use:

- Matrix rain effects
- Hacker-style green text everywhere
- Excessive neon effects
- Binary code backgrounds
- Hollywood hacker aesthetics
- Overly dark black backgrounds

COLOR SYSTEM

Use ONLY TWO PRIMARY COLORS across the entire website.

Primary Background:

0A192F (Midnight Navy)

Primary Accent:

00E5FF (Electric Cyber Cyan)

Supporting neutrals may be derived from the background color through lighter and darker shades, but do not introduce additional theme colors.

Cyber-themed components such as:

- Threat radar
- Attack visualizations
- Metrics
- Network diagrams
- Interactive graphs

should use controlled variations of the cyan accent with opacity changes rather than introducing new colors.

DESIGN STYLE

Create a premium enterprise-grade appearance similar to:

- Threat intelligence platforms
- SIEM dashboards
- Security analytics products
- Modern SOC environments

Design characteristics:

- Clean layout
- Glassmorphism cards
- Thin accent borders
- Soft glow effects
- Professional typography
- Excellent spacing
- High readability
- Smooth animations
- Modern dashboard aesthetics

Typography:

- Inter or
- Geist or
- IBM Plex Sans

Use large, confident headings and clean body text.

HERO SECTION REDESIGN

Replace the standard developer hero section with a Threat Intelligence Dashboard.

Create a hero dashboard containing:

Security Status Overview

Metrics such as:

- Threats Monitored
- Security Labs Completed
- CTF Challenges Solved
- Projects Delivered
- Research Publications

Include animated counters.

Add a live system status panel:

STATUS: MONITORING GLOBAL THREAT LANDSCAPE

Include subtle pulse animations.

The hero should immediately communicate cybersecurity expertise.

THREAT INTELLIGENCE RADAR

Add an interactive radar visualization below the hero.

Requirements:

- Rotating radar sweep
- Pulsing threat nodes
- Hover interactions
- Smooth animation
- Professional appearance

Threat categories:

- Malware
- Phishing
- Botnets
- Ransomware
- APT Groups
- Insider Threats

Use:

- SVG or
- Canvas or
- D3.js

The radar should become one of the visual focal points of the website.

GLOBAL CYBER ATTACK MAP

Create a world map section displaying simulated cyber attack activity.

Features:

- Animated attack paths
- Pulsing origin and destination points
- Flowing connection lines
- Smooth motion effects

The attack map should resemble a professional threat monitoring platform.

Use realistic but simulated cybersecurity activity if live feeds are unavailable.

THREAT LANDSCAPE PANEL

Create a dedicated section titled:

Current Threat Landscape

Display:

- Latest CVEs
- Emerging vulnerabilities
- Malware campaigns
- Threat actor activity
- Security advisories

Structure as dashboard cards.

Design should resemble an intelligence feed.

If APIs are unavailable, create a modular architecture for future integration.

SECURITY METRICS DASHBOARD

Create an animated metrics section.

Examples:

Labs Completed CTFs Solved Security Reports Written Research Projects Vulnerabilities Assessed

Use:

- Count-up animations
- Hover effects
- Clean dashboard cards

PROJECTS REDESIGN

Transform projects into Cybersecurity Case Studies.

For every project include:

Problem Statement

Tools Used

Methodology

Key Findings

Outcome

Security Domain

Relevant Technologies

Visual hierarchy should resemble consulting or security assessment reports.

MITRE ATT&CK SECTION

Create a dedicated MITRE ATT&CK visualization.

Show expertise across:

- Reconnaissance
- Initial Access
- Persistence
- Privilege Escalation
- Defense Evasion
- Credential Access
- Discovery
- Lateral Movement
- Collection
- Exfiltration

Represent these as:

- Interactive cards or
- Attack chain visualization

Use subtle hover interactions.

SECURITY SKILLS MATRIX

Replace traditional skill badges.

Create a Security Capability Matrix with categories:

Defensive Security

Examples:

- SIEM
- Threat Hunting
- Detection Engineering
- Incident Response

Offensive Security

Examples:

- Nmap
- Burp Suite
- Metasploit
- Web Security Testing

Cloud Security

Examples:

- IAM
- Cloud Monitoring
- Security Architecture

Programming

Examples:

- Python
- JavaScript
- Automation
- AI Security

Represent skill levels using professional progress indicators.

NETWORK BACKGROUND ELEMENTS

Introduce subtle cybersecurity-inspired visual elements:

- Network topology lines
- Packet-flow animations
- Hexagonal patterns
- Security grid overlays
- Data stream particles
- Connection nodes

Keep effects lightweight and elegant.

TERMINAL COMPONENT

Include a small professional terminal widget.

Example functionality:

whoami

Current Focus

Specialization

Research Interests

Keep it compact and modern.

GLASSMORPHISM COMPONENTS

Apply consistently across:

- Dashboard cards
- Metrics
- Threat feeds
- Project cards
- Contact section

Characteristics:

- Soft transparency
- Thin borders
- Mild blur
- Subtle shadows

ANIMATIONS

Implement:

- Framer Motion
- GSAP or
- CSS animations

Requirements:

- Smooth page transitions
- Radar sweeps
- Counter animations

- Hover interactions
- Attack path animations
- Fade and slide effects

Animations should feel premium and professional.

RESPONSIVENESS

Ensure perfect responsiveness on:

- Desktop
- Laptop
- Tablet
- Mobile

The dashboard experience should remain usable on smaller screens.

PERFORMANCE

Maintain excellent performance:

- Lazy loading
- Optimized animations
- Efficient rendering
- Lighthouse-friendly implementation

FINAL GOAL

The finished website should feel like a modern Cyber Threat Intelligence Platform that also functions as a personal cybersecurity portfolio.

When visitors land on the website they should immediately think:

"This person works in cybersecurity and understands modern security operations."

Generate production-quality code and redesign the entire user interface accordingly while preserving all existing portfolio content.
